

## Remote Management of Electronic Signs

### Need:

Multiled, a manufacturer of all types of electronic signs, conveyed to us their need to remotely manage the exchange currency rates, especially manufactured for banks and financial institutions.

### Equipments

EXEMYS - SSE232-LE

### Solution:

The electronic signs had a RS232 serial port, through which the information to be displayed was loaded, and this was done by means of a PC and dedicated software. This was done locally, that is the PC directly connected to the sign.

In banks and financial institutions there is a possibility of using the data LAN for this purpose, that is why a decision was made to use Exemys Serial Server Model SSE232-LE.

The server was connected on one side to the electronic sign serial port and on the other side to the LAN. With software designed by Multiled, the signs can be accessed and programmed from the distance, without the need of getting close to them, considering that this would be impossible, given the location where these signs are usually installed.
